2-pile Nim with a Restricted Number of Move-size Imitations

Urban Larsson, Göteborg

Seminariet i diskret matematik, GU

April 14, 2008

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

To my daughter Hanna, whom I have played hundreds of 'imitation games' with.

<□ > < @ > < E > < E > E のQ @

We are going to study impartial games like

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

We are going to study impartial games like

2-pile Nim,

We are going to study impartial games like

Muller twists.

We are going to study impartial games like

- 2-pile Nim,
- Wythoff Nim

and variations of these, such as

- move-size dynamic variations and
- Muller twists.

Then as a main theorem we are going to show a correspondance between the winning positions of different variations of 2-pile Nim.

We are going to study impartial games like

- 2-pile Nim,
- Wythoff Nim

and variations of these, such as

- move-size dynamic variations and
- Muller twists.

Then as a main theorem we are going to show a correspondance between the winning positions of different variations of 2-pile Nim.

At last, and in a slightly different setting, we are going to look at when there is a useful second player strategy for a game. When can he be "certain to learn" the winning strategy while playing (given that the first player knows the strategy).

(Bouton's) Nim (1902) is a 2-player game on a positive number of heaps of tokens (starting pile-sizes = random choice). Players alternate to remove a number of tokens from precisely one of the piles. The last player to remove a token wins the game.

(Bouton's) Nim (1902) is a 2-player game on a positive number of heaps of tokens (starting pile-sizes = random choice). Players alternate to remove a number of tokens from precisely one of the piles. The last player to remove a token wins the game.

Bouton discovered a complete theory on the winning strategy for this important impartial game - in a specific sense "the mother" of all other impartial games.

(Bouton's) Nim (1902) is a 2-player game on a positive number of heaps of tokens (starting pile-sizes = random choice). Players alternate to remove a number of tokens from precisely one of the piles. The last player to remove a token wins the game.

Bouton discovered a complete theory on the winning strategy for this important impartial game - in a specific sense "the mother" of all other impartial games. The Sprague-Grundy theory on addition of impartial games says that every impartial game is equivalent to a Nim-heap.

(Bouton's) Nim (1902) is a 2-player game on a positive number of heaps of tokens (starting pile-sizes = random choice). Players alternate to remove a number of tokens from precisely one of the piles. The last player to remove a token wins the game.

Bouton discovered a complete theory on the winning strategy for this important impartial game - in a specific sense "the mother" of all other impartial games. The Sprague-Grundy theory on addition of impartial games says that every impartial game is equivalent to a Nim-heap. Here we restrict our interest to Nim on 2 piles of tokens.

Impartial games

Our games belong to the family of finite impartial games, where 2 players alternate to move; they obey to the same gamerules; there is no chance device and there is a final position which decides the winner of the game.

Impartial games

Our games belong to the family of finite impartial games, where 2 players alternate to move; they obey to the same gamerules; there is no chance device and there is a final position which decides the winner of the game. Here we only play the normal version where the last player to move wins.

Our games belong to the family of finite impartial games, where 2 players alternate to move; they obey to the same gamerules; there is no chance device and there is a final position which decides the winner of the game. Here we only play the normal version where the last player to move wins.

A position from which the player who made the last move, the previous player, can win given best play, is called a *P*-position. A position from which the next player can win, given best play, is called an *N*-position. Given a game *G*, denote with \mathcal{P}_G , the set of all *P*-positions of *G*.

A basic fact for a combinatorial game

Recall:

A basic fact for a combinatorial game

Recall:

 a position is a *P*-position iff none of its followers is a *P*-position.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

A basic fact for a combinatorial game

Recall:

- a position is a *P*-position iff none of its followers is a *P*-position.
- ► a position is an N-position iff there is a P-position in its set of followers.

Our games can be played on two piles of tokens and where the players may only remove tokens from the top of the piles (given some rules). Such games are known as (2-pile) take away games or Nim-like games.

Our games can be played on two piles of tokens and where the players may only remove tokens from the top of the piles (given some rules). Such games are known as (2-pile) take away games or Nim-like games.

Notation:

We use the notation (x, y) for a game-position, where x, y are non-negative integers denoting the respective pileheights.

Our games can be played on two piles of tokens and where the players may only remove tokens from the top of the piles (given some rules). Such games are known as (2-pile) take away games or Nim-like games.

Notation:

We use the notation (x, y) for a game-position, where x, y are non-negative integers denoting the respective pileheights. We rather write $\{x, y\}$ if we want to emphasise that (x, y) and (y, x)are considered the same. For example, if $(x, y) \in \mathcal{P} \Leftrightarrow (y, x) \in \mathcal{P}$.

Our games can be played on two piles of tokens and where the players may only remove tokens from the top of the piles (given some rules). Such games are known as (2-pile) take away games or Nim-like games.

We rather write $\{x, y\}$ if we want to emphasise that (x, y) and (y, x)are considered the same. For example, if $(x, y) \in \mathcal{P} \Leftrightarrow (y, x) \in \mathcal{P}$.

Special notation:

For a take-away game on two piles of tokens, let a leading pile denote a pile with currently the least number of tokens or possibly the same. If a pile is not leading it is non-leading.

Our games can be played on two piles of tokens and where the players may only remove tokens from the top of the piles (given some rules). Such games are known as (2-pile) take away games or Nim-like games.

Notation:

We use the notation (x, y) for a game-position, where x, y are non-negative integers denoting the respective pileheights. We rather write $\{x, y\}$ if we want to emphasise that (x, y) and (y, x)are considered the same. For example, if $(x, y) \in \mathcal{P} \Leftrightarrow (y, x) \in \mathcal{P}$.

Special notation:

For a take-away game on two piles of tokens, let a leading pile denote a pile with currently the least number of tokens or possibly the same. If a pile is not leading it is non-leading.

Remark: The leading pile might change from one move to the next.

(2, 1)-Imitation Nim

Example:

Let us play a game where at most one imitation is allowed and where the starting position is (2, 2). Who wins, the first or second player?

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

(2, 1)-Imitation Nim

Example:

Let us play a game where at most one imitation is allowed and where the starting position is (2, 2). Who wins, the first or second player?

But first some notation:

The default color of a token is blue. A token is green if removal of the token (including the ones above) implies that an *imitation counter* is increased by one. A token is yellow if it, for the reason of the previous player's move, may not be removed. The imitation counter is drawn as a black square.

▶ The starting position is (2,2).

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

- ▶ The starting position is (2,2).
- ▶ The first player moves to (1,2);

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- ▶ The starting position is (2,2).
- ▶ The first player moves to (1,2);

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- ▶ The starting position is (2,2).
- ▶ The first player moves to (1,2);
- Removing a green token means to imitate the previous move;

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

- ▶ The starting position is (2,2).
- ▶ The first player moves to (1,2);
- Removing a green token means to imitate the previous move;
- If the second player moves to (0,2) he will lose right away, so he rather moves to (1,1);

- ► The starting position is (2,2).
- ▶ The first player moves to (1,2);
- Removing a green token means to imitate the previous move;
- If the second player moves to (0,2) he will lose right away, so he rather moves to (1,1);
- The imitation counter increases with one unit;

- ► The starting position is (2,2).
- ▶ The first player moves to (1,2);
- Removing a green token means to imitate the previous move;
- If the second player moves to (0,2) he will lose right away, so he rather moves to (1,1);
- The imitation counter increases with one unit;

▶ The first player moves to (0,1);

- ▶ The starting position is (2,2).
- ▶ The first player moves to (1,2);
- Removing a green token means to imitate the previous move;
- If the second player moves to (0,2) he will lose right away, so he rather moves to (1,1);
- The imitation counter increases with one unit;
- ▶ The first player moves to (0,1);
- This time, the second player may not imitate, in fact he can't move at all.

- ▶ The starting position is (2,2).
- ▶ The first player moves to (1,2);
- Removing a green token means to imitate the previous move;
- If the second player moves to (0,2) he will lose right away, so he rather moves to (1,1);
- The imitation counter increases with one unit;
- ▶ The first player moves to (0,1);
- This time, the second player may not imitate, in fact he can't move at all.
- So (2,2) is a next player winning position...unlike 2-pile Nim.

The game of W.A. Wythoff

The game of Wythoff Nim is an impartial game played on two piles of tokens. It was published 1907 in the article 'A modification of the game of Nim' by W.A. Wythoff, a Dutch mathematician.

The game of W.A. Wythoff

The game of Wythoff Nim is an impartial game played on two piles of tokens. It was published 1907 in the article 'A modification of the game of Nim' by W.A. Wythoff, a Dutch mathematician. As an addition to the rules of the original game of Nim, Wythoff allows removal of an equal number of tokens from each pile.

The game of W.A. Wythoff

The game of Wythoff Nim is an impartial game played on two piles of tokens. It was published 1907 in the article 'A modification of the game of Nim' by W.A. Wythoff, a Dutch mathematician. As an addition to the rules of the original game of Nim, Wythoff allows removal of an equal number of tokens from each pile.

The game is maybe more known as the impartial game "Corner the queen" (Rufus P. Isaacs, 1960), where the two players alternate to move one single queen - aiming to get to the bottom left corner of a (large) chessboard. The distance to this corner must by each move decrease and precisely the ordinary chess-queen moves are allowed. The winner is the player who first puts the queen in the corner.

 $Nim \rightarrow Wythoff$ Nim, by adjoining all $\ensuremath{\textit{P}}\xspace$ positions of Nim as moves in Wythoff Nim.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Nim \rightarrow Wythoff Nim, by adjoining all *P*-positions of Nim as moves in Wythoff Nim. This idea I have adapted from a paper by A. Fraenkel (where he discusses extensions to Nim on several piles).

Nim \rightarrow Wythoff Nim, by adjoining all *P*-positions of Nim as moves in Wythoff Nim. This idea I have adapted from a paper by A. Fraenkel (where he discusses extensions to Nim on several piles). Indeed the *P*-positions of 2-pile Nim are $\{(k, k) | k \in \mathbb{Z}^+\}$.

Nim \rightarrow Wythoff Nim, by adjoining all *P*-positions of Nim as moves in Wythoff Nim. This idea I have adapted from a paper by A. Fraenkel (where he discusses extensions to Nim on several piles). Indeed the *P*-positions of 2-pile Nim are $\{(k, k) | k \in \mathbb{Z}^+\}$. These are the diagonal moves of Corner the queen.

A variation of Wythoff's game

Let us look at an animation of a game, that we will denote by (2, 1)-Wythoff Nim, where the previous player may, by her free choice and before the next player moves, "block off" at most one diagonal option from the next players set of options.

A variation of Wythoff's game

Let us look at an animation of a game, that we will denote by (2,1)-Wythoff Nim, where the previous player may, by her free choice and before the next player moves, "block off" at most one diagonal option from the next players set of options. A pair of tokens are painted red if this pair (together with the tokens on top), for the sole reason of the previous player's "because-l-am-saying-so", may not be removed. Notice that one of the tokens may be removed, but noth both at the same time.

▶ The starting position is (2,2).

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- ▶ The starting position is (2,2).
- The previous (second) player blocks off removal of all tokens;

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

- ▶ The starting position is (2,2).
- The previous (second) player blocks off removal of all tokens;
- But the second player can only prolong the first players path to victory;

- ▶ The starting position is (2,2).
- The previous (second) player blocks off removal of all tokens;
- But the second player can only prolong the first players path to victory;

 The first player moves to (1,1) and makes the obvious block;

- ▶ The starting position is (2,2).
- The previous (second) player blocks off removal of all tokens;
- But the second player can only prolong the first players path to victory;

 The first player moves to (1,1) and makes the obvious block;

- ▶ The starting position is (2,2).
- The previous (second) player blocks off removal of all tokens;
- But the second player can only prolong the first players path to victory;
- The first player moves to (1,1) and makes the obvious block;
- The second player may remove either one of the tokens, but not both;

- ▶ The starting position is (2,2).
- The previous (second) player blocks off removal of all tokens;
- But the second player can only prolong the first players path to victory;
- The first player moves to (1,1) and makes the obvious block;
- The second player may remove either one of the tokens, but not both;
- and since a player may not block off a single token,

- ▶ The starting position is (2,2).
- The previous (second) player blocks off removal of all tokens;
- But the second player can only prolong the first players path to victory;
- The first player moves to (1,1) and makes the obvious block;
- The second player may remove either one of the tokens, but not both;
- and since a player may not block off a single token,
- the first player wins, so (2,2) is a next player winning position...

- ▶ The starting position is (2,2).
- The previous (second) player blocks off removal of all tokens;
- But the second player can only prolong the first players path to victory;
- The first player moves to (1,1) and makes the obvious block;
- The second player may remove either one of the tokens, but not both;
- and since a player may not block off a single token,
- the first player wins, so (2,2) is a next player winning position...

...just like for (2,1)-Imitation Nim...

An initial observation

Let \leftrightarrow denote "identical" if "treated as starting positions". Then:

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

An initial observation

Let \leftrightarrow denote "identical" if "treated as starting positions". Then:

"P-positions of 2-pile Nim where at most a fixed number, say $k-1 \ge 0$, imitations in a sequence from one and the same player is allowed"

An initial observation

Let \leftrightarrow denote "identical" if "treated as starting positions". Then:

"P-positions of 2-pile Nim where at most a fixed number, say $k - 1 \ge 0$, imitations in a sequence from one and the same player is allowed" \leftrightarrow "P-positions of a variant of Wythoff Nim with a Muller twist, where at most k - 1 positions may be blocked".

An initial observation

Let \leftrightarrow denote "identical" if "treated as starting positions". Then:

"P-positions of 2-pile Nim where at most a fixed number, say $k-1 \ge 0$, imitations in a sequence from one and the same player is allowed" \leftrightarrow "P-positions of a variant of Wythoff Nim with a Muller twist, where at most k-1 positions may be blocked".

Returning to Wythoff's game

Observation: If we put k = 1 then we get: "*P*-positions of a variation of 2-pile Nim where imitation is not allowed"

An initial observation

Let \leftrightarrow denote "identical" if "treated as starting positions". Then:

"P-positions of 2-pile Nim where at most a fixed number, say $k-1 \ge 0$, imitations in a sequence from one and the same player is allowed" \leftrightarrow "P-positions of a variant of Wythoff Nim with a Muller twist, where at most k-1 positions may be blocked".

Returning to Wythoff's game

Observation: If we put k = 1 then we get: "*P*-positions of a variation of 2-pile Nim where imitation is not allowed" \leftrightarrow *P*-positions of Wythoff Nim.

Partitions of the natural numbers

Beatty's theorem (1927) says:

Theorem

If x and y are positive irrational numbers such that $\frac{1}{x} + \frac{1}{y} = 1$ then $\{\lfloor ix \rfloor \mid i \in \mathbb{N}\} \sqcup \{\lfloor iy \rfloor \mid i \in \mathbb{N}\} = \mathbb{N}$.

Partitions of the natural numbers

Beatty's theorem (1927) says:

Theorem

If x and y are positive irrational numbers such that $\frac{1}{x} + \frac{1}{y} = 1$ then $\{\lfloor ix \rfloor \mid i \in \mathbb{N}\} \sqcup \{\lfloor iy \rfloor \mid i \in \mathbb{N}\} = \mathbb{N}$.

As a consequence of Beattys theorem, the sequence of "Wythoff-pairs" that we denote with

$$\mathcal{P}_W = (\{a_i, b_i\})_{i=0}^{i=\infty},$$

 $0 \le a_i \le b_i$, can be generated in polynomial time. It exhibits some beautiful properties:

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Theorem Let $\mathcal{P}_W = (\{a_i, b_i\})_{i=0}^{i=\infty}$ be as above. Then

Theorem Let $\mathcal{P}_W = (\{a_i, b_i\})_{i=0}^{i=\infty}$ be as above. Then (i) (a_i) and (b_i) are strictly increasing sequences;

Theorem Let $\mathcal{P}_W = (\{a_i, b_i\})_{i=0}^{i=\infty}$ be as above. Then (i) (a_i) and (b_i) are strictly increasing sequences;

Theorem

Let $\mathcal{P}_W = (\{a_i, b_i\})_{i=0}^{i=\infty}$ be as above. Then (i) (a_i) and (b_i) are strictly increasing sequences; (ii) $((a_i, b_i))$ partition the natural numbers and $\{b_i - a_i | i \in \mathbf{N}\} = \mathbf{N};$

Theorem

Let $\mathcal{P}_W = (\{a_i, b_i\})_{i=0}^{i=\infty}$ be as above. Then (i) (a_i) and (b_i) are strictly increasing sequences; (ii) $((a_i, b_i))$ partition the natural numbers and $\{b_i - a_i | i \in \mathbf{N}\} = \mathbf{N};$

Definition

The game of (k, m)-Wythoff Nim, $W_{k,m}$, is the game where the next player may

- I. remove tokens as in 2-pile Nim, or
- II. remove 0 < i tokens from one of the piles and remove 0 < j tokens from the other pile as long as $0 \le |j i| < m$ (Fraenkel).

Definition

The game of (k, m)-Wythoff Nim, $W_{k,m}$, is the game where the next player may

- I. remove tokens as in 2-pile Nim, or
- II. remove 0 < i tokens from one of the piles and remove 0 < j tokens from the other pile as long as $0 \le |j i| < m$ (Fraenkel).

Definition

The game of (k, m)-Wythoff Nim, $W_{k,m}$, is the game where the next player may

- I. remove tokens as in 2-pile Nim, or
- II. remove 0 < i tokens from one of the piles and remove 0 < j tokens from the other pile as long as $0 \le |j i| < m$ (Fraenkel).
- III. but before the next player makes his move, the previous player may declare at most k 1 of the type-II moves, with i = j, as blocked options (Hegarty, Larsson).

The set $\mathcal{P}_{W_{k,m}}$

One can generate the *P*-positions of (k, m)-Wythoff Nim via a so called minimal exlusive algorithm. We use the following standard notation: For X a set of natural numbers, mex X denotes the least natural number $\notin X$.

The set $\mathcal{P}_{W_{k,m}}$

Definition

Given positive integers k and m, the integer sequences (a_i) and (b_i) are defined as follows: $a_0 = b_0 = 0$ and for i > 0

$$\begin{array}{ll} a_i & := & \max\{a_j, b_j \mid 0 \leq j < i\}; \\ b_i & := & a_i + \delta_i, \end{array}$$

where $\delta_i = \delta_i(k, m) := \lfloor \frac{i}{k} \rfloor m$.

Terminology mostly for move-size dynamic games

Notation:

Let G be a game. Let us introduce the following "non-standard" terminology. A position is dynamic if it is impossible to tell whether it is a P- or N-position without any information on the previous move(s). If a position is not dynamic it is non-dynamic.

Terminology mostly for move-size dynamic games

Notation:

Let G be a game. Let us introduce the following "non-standard" terminology. A position is dynamic if it is impossible to tell whether it is a P- or N-position without any information on the previous move(s). If a position is not dynamic it is non-dynamic. With this notation we can partition the set of positions of G into 3 sets, namely

- dynamic positions;
- non-dynamic
 - P-positions;
 - N-positions.

Note: This above notation is only relevant for move-size dynamic games. Each position of Wythoff Nim is clearly non-dynamic. The winning nature of a dynamic position may be classified for a specific 'partie' but not for a game position in general, where the value of the counter L is 'indecidable'.

Note: This above notation is only relevant for move-size dynamic games. Each position of Wythoff Nim is clearly non-dynamic. The winning nature of a dynamic position may be classified for a specific 'partie' but not for a game position in general, where the value of the counter L is 'indecidable'.

As I understand it, game-theory has not yet been widely studied from the specific point of view of a particular game, given "a specific time and a certain location".

Note: This above notation is only relevant for move-size dynamic games. Each position of Wythoff Nim is clearly non-dynamic. The winning nature of a dynamic position may be classified for a specific 'partie' but not for a game position in general, where the value of the counter L is 'indecidable'.

As I understand it, game-theory has not yet been widely studied from the specific point of view of a particular game, given "a specific time and a certain location".

Maybe, a 'partie'-theory has yet to be developed...

- (i) Classical Wythoff Nim yes;
- (ii) The blocking variation of Wythoff's game no (the first player can by simple manouvers "conceal" many of the *P*-positions);
- (iii) Imitation Nim yes, by "carefully" imitating the previous player's moves and being aware that each $W_{k,m}$ *P*-position has difference of pileheights $\equiv 0 \pmod{m}$.

A second strategy for (k, m)-Imitation Nim.

For Imitation Nim, the second player should:

(ロ)、(型)、(E)、(E)、 E) の(の)
A second strategy for (k, m)-Imitation Nim.

For Imitation Nim, the second player should:

try and imitate the previous player's move. If he can, and if he makes sure that the condition (iii) above is satisfied, then he has moved to a *P*-free position;

A second strategy for (k, m)-Imitation Nim.

For Imitation Nim, the second player should:

- try and imitate the previous player's move. If he can, and if he makes sure that the condition (iii) above is satisfied, then he has moved to a *P*-free position;
- if he can/may not imitate, then it suffices to move to a position (a, c) where c is the largest permissable number of tokens of the non-leading pile. Indeed this move 'forces' the first player to move (a, c) → (a', c) where a' is the greatest integer less than a such that there is a P-position (a', b') of (k, m)-Wythoff Nim (and P-free iff k > 1). Then for this particular game we get L((a', b')) = 1.

Example: (2,3)-Imitation Nim

Now, put k = 2 and m = 3. The first few *P*-positions of (2,3)-Wythoff Nim are:

 $(0,0), (1,1), (2,5), (3,6), (4,10), (7,13), \ldots$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ● ● ●

Example: (2,3)-Imitation Nim

Now, put k = 2 and m = 3. The first few *P*-positions of (2, 3)-Wythoff Nim are:

 $(0,0), (1,1), (2,5), (3,6), (4,10), (7,13), \ldots$

These positions are well-known to the first player, but not to the second player. Suppose the first player is about to move from (4,9), an *N*-stable position.

- "Imitation provides means for learning". Our Imitation games offer nice second player strategies for learning the first player's winning strategy. And indeed the main ingreadient for such a strategy is to imitate the first players moves. The setting of our blocking games does not allow a corresponding second player strategy, since the first player may 'conceal' *P*-positions.

Questions

Questions

How can one apply our ideas to other impartial games, for example *n*-pile Nim, or maybe Keyles?

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Questions

- How can one apply our ideas to other impartial games, for example n-pile Nim, or maybe Keyles?
- Does some analog to the main theorem hold? Does some analog to the second player strategy hold?

Thank you!

- Suppose our starting position is an N-stable position, say (3,4).
- We want to show that this position is a (non-dynamic) N-position of Imitation Nim.
- The first player may, independent of previous moves, remove two tokens from the leading pile.

The second player may not move to (the *P*-stable position) (1,2).

- Suppose our starting position is an N-stable position, say (3,4).
- We want to show that this position is a (non-dynamic) N-position of Imitation Nim.
- The first player may, independent of previous moves, remove two tokens from the leading pile.
- The second player may not move to (the *P*-stable position) (1,2).
- For Wythoff Nim, there are no *P*-free positions and the position (0,0) is no option. Also, *N*-free (0,4) is no good.

- Suppose our starting position is an N-stable position, say (3,4).
- We want to show that this position is a (non-dynamic) N-position of Imitation Nim.
- The first player may, independent of previous moves, remove two tokens from the leading pile.
- The second player may not move to (the *P*-stable position) (1,2).
- For Wythoff Nim, there are no *P*-free positions and the position (0,0) is no option. Also, *N*-free (0,4) is no good.
- The N-free position (1,3) is an option, but for this particular game L((1,3)) = 0, since the player have removed tokens from a non-leading pile.

- Suppose our starting position is an N-stable position, say (3,4).
- We want to show that this position is a (non-dynamic) N-position of Imitation Nim.
- The first player may, independent of previous moves, remove two tokens from the leading pile.
- The second player may not move to (the *P*-stable position) (1,2).
- For Wythoff Nim, there are no *P*-free positions and the position (0,0) is no option. Also, *N*-free (0,4) is no good.
- The N-free position (1,3) is an option, but for this particular game L((1,3)) = 0, since the player have removed tokens from a non-leading pile.
- The first player responds with a move to the P-stable position (1,2)... wins.

From this argument it is not hard to see that all *N*-stable positions of form (I) belongs to $\mathcal{N}_{l_{1,1}}$. With a little extra work the argument can be extended to general *k* and *m*. **Preturn**

 An example of an N-stable position is (3,4).

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

 An example of an N-stable position is (3,4).

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

- An example of an N-stable position is (3,4).
- Independend of previous move(s), there is precisely one winning move.

- An example of an N-stable position is (3,4).
- Independend of previous move(s), there is precisely one winning move.
- ► On the other hand (1,4) is an example of an *N*-free position.

- An example of an N-stable position is (3,4).
- Independend of previous move(s), there is precisely one winning move.
- ► On the other hand (1,4) is an example of an *N*-free position.

- An example of an N-stable position is (3,4).
- Independend of previous move(s), there is precisely one winning move.
- On the other hand (1,4) is an example of an N-free position.
- The next player may not move to the Wythoff Nim P-position (1,2).

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

- An example of an N-stable position is (3,4).
- Independend of previous move(s), there is precisely one winning move.
- On the other hand (1,4) is an example of an N-free position.
- The next player may not move to the Wythoff Nim P-position (1,2).
- He rather tries to find a dynamic *P*-position. But then he needs to remove tokens from the leading pile.

- An example of an N-stable position is (3,4).
- Independend of previous move(s), there is precisely one winning move.
- On the other hand (1,4) is an example of an *N*-free position.
- The next player may not move to the Wythoff Nim P-position (1,2).
- He rather tries to find a dynamic *P*-position. But then he needs to remove tokens from the leading pile.
- The next player may now remove all tokens, he wins. So (3,4) is a (non-dynamic) N-position of Imitation Nim. return
